-These parts can be ordered as a kit - Part No. 2207324.

## Setting Up Your Excitor

## Mounting of Base Plate

Base should be mounted so the full-width lip will hold the back edge of frame, using round head bolts, washers, and nuts as shown. (Cannon stainless steel bolts, Accessory No. 2250111 are ideal.) Alternately, depending on the surface you're fastening to, you may need to use round head screws. Use the Base as a template to mark locations of the required holes.

Note: The undercut screws provided (\#9280311, pkg. of 4) are used to mount base plate key \#29 to Cannon Swivel Base \#2207325 or gimbal mount \#2250928.

## Mounting Excltor to Base Plate

The Excitor can be used for either vertical or horizontal jigging.
For horizontal use, slip the protruding edge on the bottom under the lip of the base plate. Make sure the retainer lug is seated in the recess on the front of the housing and tighten thumb screw.
For vertical use, stand unit on end and follow the same procedures as noted above.

## Electrical Connections

The ribbed or printed lead is the positive of the battery cable, key \#45, and must be hooked to the positive post on the battery. We recommend that a 15 amp fuse be installed at the battery in the positive lead Cannon Optional Fuse Holder part \#2250001.

## FIGURE 1

OPTIONAL FUSE HOLDER
CANNON PART 2250001

If the power cord is hooked to the battery with the leads reversed, the controls will not function properly. The unit will simply oscillate without pausing. Disconnect the battery connections and reverse hook up.

## Assemble Rod Holder to Unit

FOR HORIZONTAL JIGGING
The unit output and the rotating support, key \#6, are splined and allow adjustment of 15 degrees between positions. Mount unit to base plate as described in mounting instructions, and turn unit on. Adjust the time control to get a pause of a few seconds at the end of each sweep. When the sweep is at full forward, shut the unit off. Loosen the knob, key \#7, on the rod holder assembly until the rotating support, key \#6, can be slipped over the output key \#53. Position the support so the rod will be approximately 25 to 30 degrees off the beam of your boat. See figure \#2. Retighten knob to lock in place.

FIGURE 3

## FOR VERTICAL JIGGING

Sland the Excitor on end as described in the mounting instructions. Follow the same procedure as noted above except the downward sweep of the rod should stop parallel with or slightly above the water line.

## Safety Cord

The safety cord is to prevent the loss of your rod and reel if a fish should strike and pull them from the rod hoider.
The safety cord, key \#9, should be attached to the molded loop of the rotating support, key \#6. Secure the other end to either the lower line guide of your rod or a secure part of your reel.
When the fish strikes, the safety cord can be removed from either end quickly with only one hand.

## Controls

The on/off switch controls the rod travel speed. The switch has a high/low and off position.
The time control knob controls the delay at each end of the rod sweep, from 0 to approximately 15 seconds.

## Service

If replacement of any internal components are necessary, we recommend the unit be serviced by a qualified Cannon service center.
