# MARLIN ELECTRIC (MAG 10 w/short stop)

## How the Short Stop System Works

The Short Stop electronic unit is capable of sensing the instant when the cable clears the water; it then turns off the downrigger while your trolling weight is still in the water to eliminate cable strain caused by excessive bouncing.

The two critical elements to accomplish this, other than the Short Stop unit itself, are the conductive rubber cable contact that completes the electrical circuit from the Short Stop to the cable, and the trolling weight insulator which enables the motor to stop with the weight still in the water.

**NOTE** — When changing cable be sure only a sixteenth of an inch (1/16") of the conductive rubber contact is extending above the hub. This ensures that it is touching the set screw at bottom of hole and will complete the circuit when cable is re-wound.

## The Short Stop System includes:

- 1 Short Stop Electronic Unit 2200924
- 2 Insulators with Clip Assembly C2751
- 3 Posigrab Motor Switch C2745
- 1 Conductive Rubber Cable Contact C2745

## Operating Your Short Stop Downrigger

**Raising Weight.** Push motor switch upward momentarily and release. Downrigger will raise weight until it reaches surface of water then automatically stop.

If you want to raise weight further, after it stops, push switch upward and hold it until weight reaches desired position, then release.

To stop weight during ascent push motor switch downward momentarily and release.

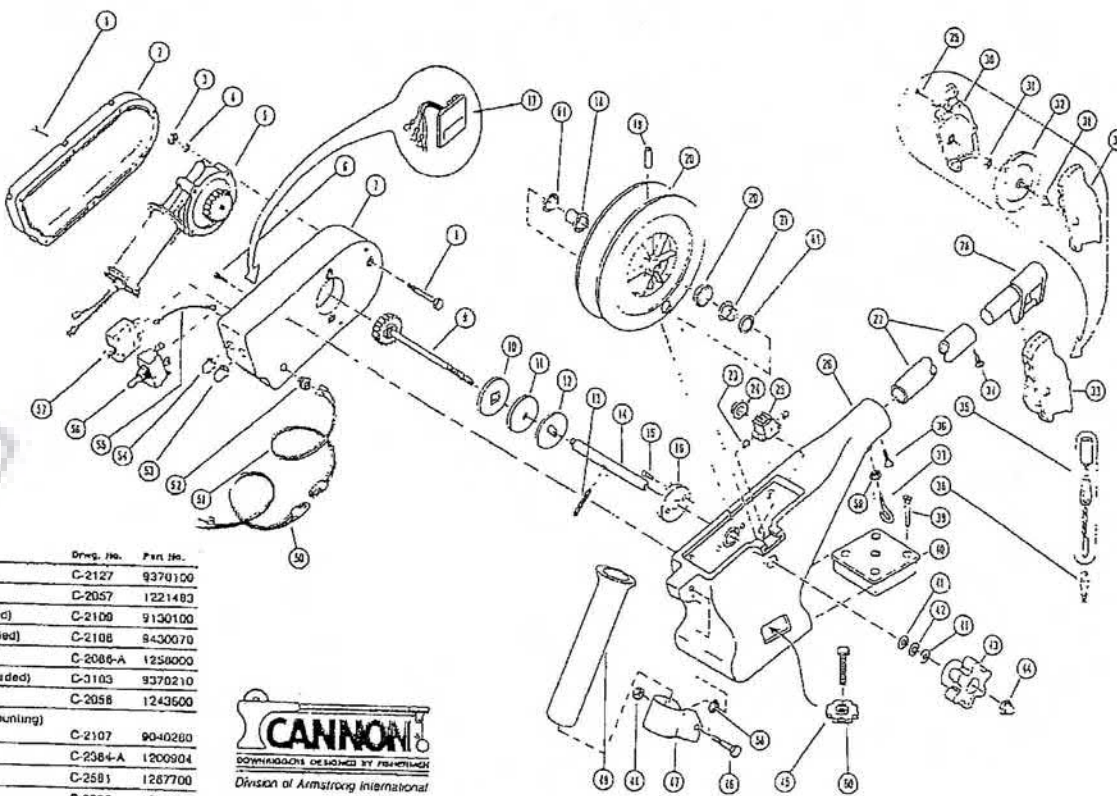

**Lowering Weight.** Push motor switch downward and hold it until weight reaches desired depth then release.

## Trouble Shooting

**Problem:** Up or down will not work.  
**Solution:** Check battery polarity.

**Problem:** Unit runs down when pushing switch up.  
**Solution:** A. Be sure violet wire is on top side of switch.  
B. If problem still exists, interchange yellow/brown and yellow wires on short stop module.

**Problem:** Unit fails to continue running up after pressing up switch, while cable is still in water.  
**Solution:** A. Check green wire connection.  
B. Boat must have ground (negative from battery) to water; through engine drive; lower unit or metal boat.  
C. Check for properly installed conductive rubber.
